

# Die Energiewende – eine Zwischenbilanz zur Wahlzeit

„Man muss das Wahre immer wiederholen, weil auch der Irrtum um uns herum immer wieder gepredigt wird und zwar nicht von Einzelnen, sondern von der Masse, in Zeitungen und Enzyklopädien, auf Schulen und Universitäten. Überall ist der Irrtum obenauf, und es ist ihm wohliger und behaglicher im Gefühl der Majorität, die stets auf seiner Seite ist.“ (Goethe)

## ***Die „Erneuerbaren“ liefern ökologisch wertvollen "Grünen Strom"***

**Dieses Versprechen ist eine arglistige Täuschung. Solar- und Windstrom sind weder grün noch ökologisch, denn:**

- 1) Die Tierwelt wird geopfert; nur wenige Beispiele: Deutsche Windturbinen töten Unmengen von Fledermäusen und vertreiben Vögel aus ihren Lebensräumen, Off-Shore Parks beeinträchtigen die maritimen Biotope. In Spanien werden jährlich viele Millionen Vögel und Fledermäuse durch Windräder getötet und in Tasmanien sind die Keilschwanzadler vom Aussterben bedroht.
- 2) Die Mais-Mono-Kulturen zerstören Böden, verändern Biotope und verbrauchen für Düngung, Pflanzenschutzmittel und Bearbeitung mehr Energie als sie liefern ([www. Climate Crimes](http://www.ClimateCrimes.com)).
- 3) Wegen der Nutzung von Ackerland für Photovoltaik und Biosprit importiert Deutschland mehr Getreide; die Weltmarktpreise steigen und in armen Ländern verhungern noch mehr Menschen, Kinder vor allem.

***Die Grünen und die  
ÖDP wollen unseren  
Strom zu 100% aus  
„Erneuerbaren“  
gewinnen***

**So mutig kann nur  
fordern, wer  
entweder ein  
schlimmes anderes  
Ziel verfolgt oder  
absolut nichts da-  
von versteht: Sonne**

**und Wind liefern  
nur in ca. 20%  
aller Stunden des  
Jahres Energie, die  
in Strom umgewan-  
delt werden kann.  
Für die anderen  
Stunden werden  
riesige  
Speicherkapazitäten  
benötigt. Noch feh-  
len sie, und noch**

**wissen wir nicht,  
welche geeignet  
sind, ob sie  
erfunden werden kön-  
nen, und wie lange  
es dauert, bis sie  
für den  
Dauerbetrieb  
einsatzfähig sind.  
Das Problem dieser  
Stromspeicherung  
ist völlig**

**ungelöst. Wenn der Anteil der „Erneuerbaren“ am Energiemix zunimmt, wächst der Bedarf an Speicherkapazität überproportional. Die mögliche Speicherkapazität begrenzt folglich ihren Anteil.**

**Welche  
Speicherkapazität  
ist erreichbar?  
Soll der Strom mit  
Pumpspeicher-  
kraftwerken (PSW)  
gespeichert werden,  
kann die  
erreichbare  
Kapazität nur sehr  
klein sein, denn  
die für den Bau**

**erforderlichen  
topographischen und  
geotechnischen  
Voraussetzungen  
sind in Deutschland  
kaum noch gegeben,  
und außerdem stoßen  
PSW-Bauvorhaben auf  
den (fast)  
unüberwindbaren  
Widerstand der  
Bevölkerung.**

***Die Sonne
